# FeeLens

What a prospect's portfolio really costs, with the source of every figure.

Proposal for Safe Capital · how it works, how accurate it is, how to use it, where it runs, what it costs

Lugano, November 2026

IN SHORT

# Four things to know

## What it does

Reads statements, cost reports, price lists and KIDs from any bank. Works out the all-in annual cost and compares it with your proposal.

## Every figure has its source

One click on a number shows the calculation and the exact spot on the page it came from. A missing cost stays missing, never zero.

## It assists the analyst, it does not replace them

Finds about 90% of fees on real documents. About 5 to 6% of accepted figures are still wrong: two people check every report.

## Proposal: a 3-month pilot

On a Safe Capital machine, 10 prospects, CHF 3,000. Then an annual licence from CHF 9,000.

THE PROBLEM

# A client's costs sit in three places

## Debited from the account

Management or advisory, custody, account fees, VAT. In cash statements and the annual cost report.

## Inside the products

Ongoing costs of funds and ETFs (TER/OCF), the margin in structured products. Never on the account: they are in the KID.

## In the trades

Brokerage, FX, stamp duty, transfer fees. In the price list of the bank that books the account.

Today an analyst spends hours putting these pieces together, and a cost they cannot find often ends up as zero. FeeLens collects them, cites them and says what is missing.

HOW IT WORKS

# Five steps, the same ones across the top of every page in the app

1

## Documents

Upload the client's PDFs (scans too) or Excel files.

2

## Check values

Every value read, boxed on the page. Accept, correct or reject.

3

## Costs

Known annual cost, what is missing, points to review.

4

## Compare

Same holdings at your tariff. Saving as a lower bound.

5

## Report

A senior approves; PDF in Italian or English.

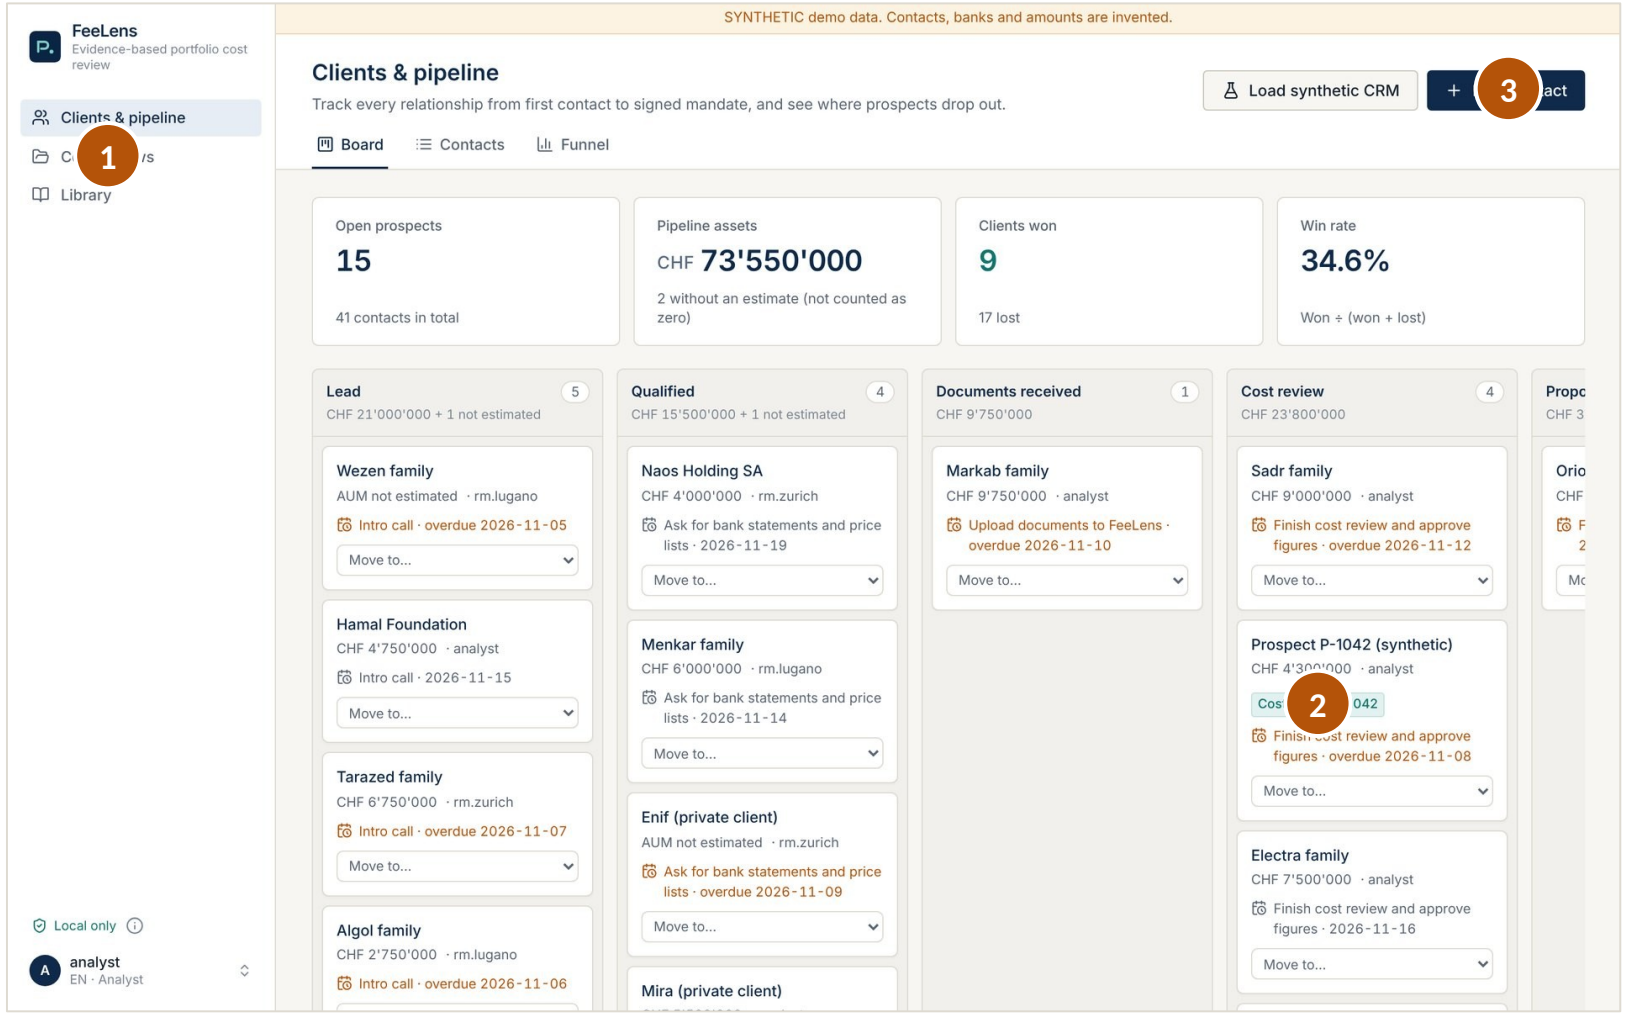

**No source, no verified figure.**

**Missing is never zero.**

**No comparable service, no savings claim.**

The three product rules

# Start from your clients: every relationship and where it stands

**1** **"Cost reviews" in the menu**

All cost reviews in progress, with assets, known cost and saving.

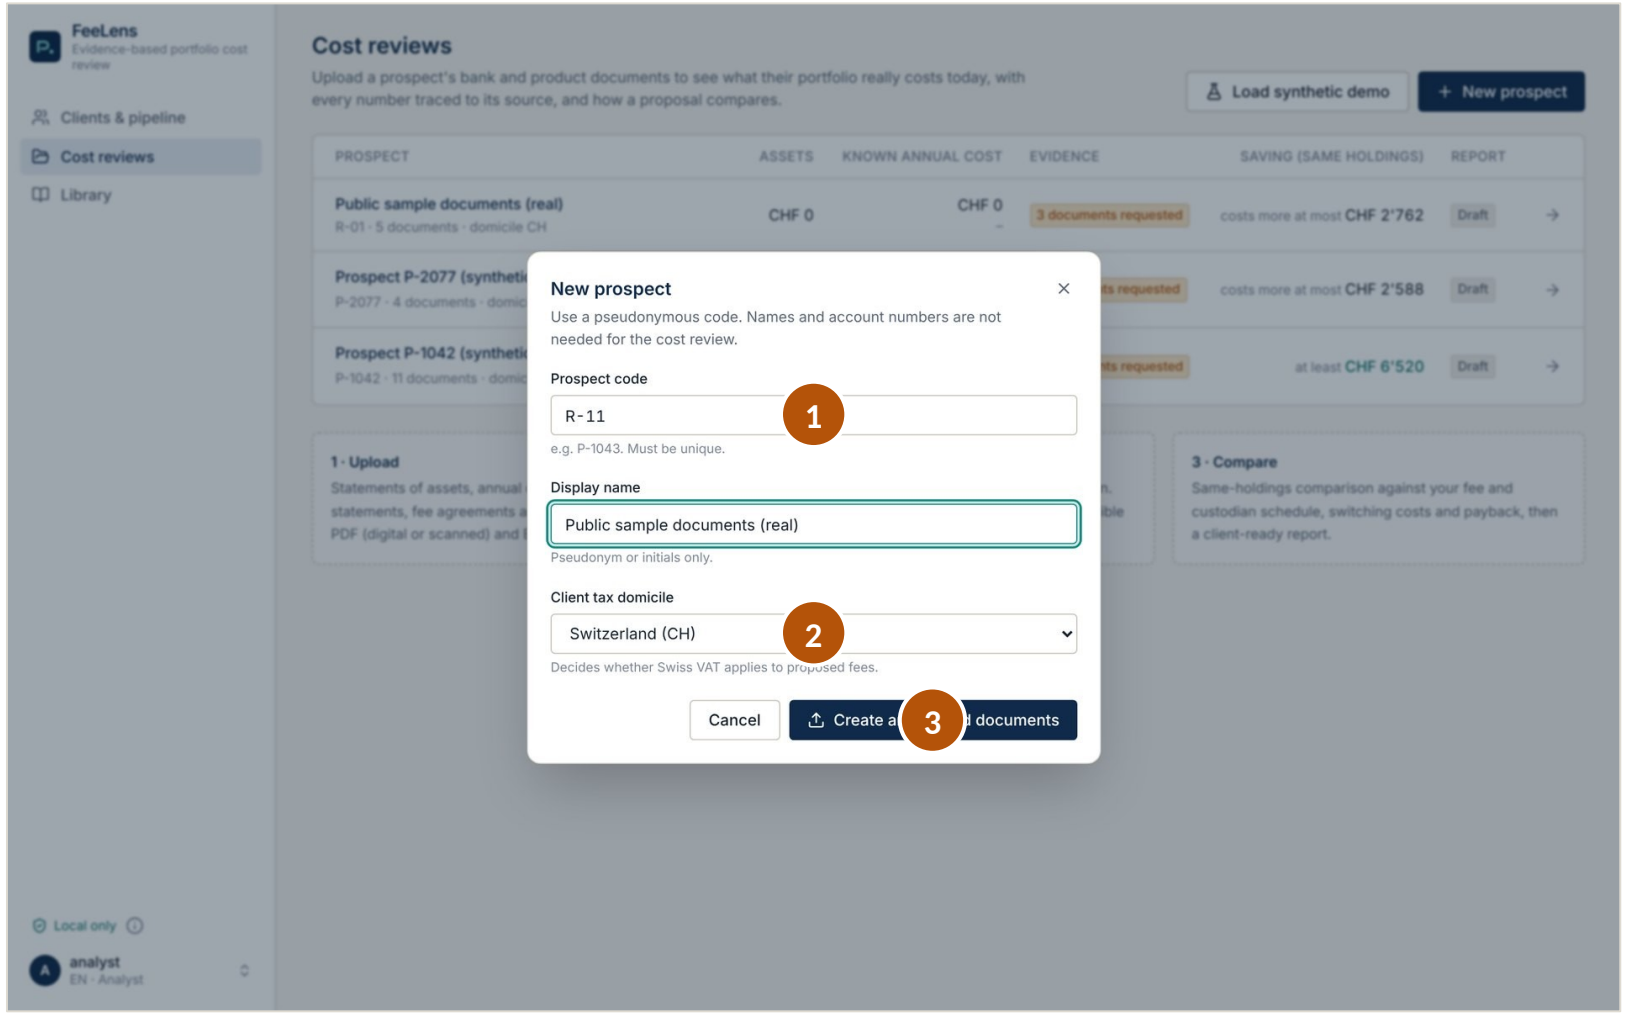

**2** **The "Cost review" column**

One click on the card opens that client's review.

**3** **"New contact"**

A prospect starts here; the funnel shows where prospects drop out.

# New review: a code, not a name

**1** **Type a code, e.g. P-1043**

Names, account numbers and IBANs are not needed. Less personal data, less risk.

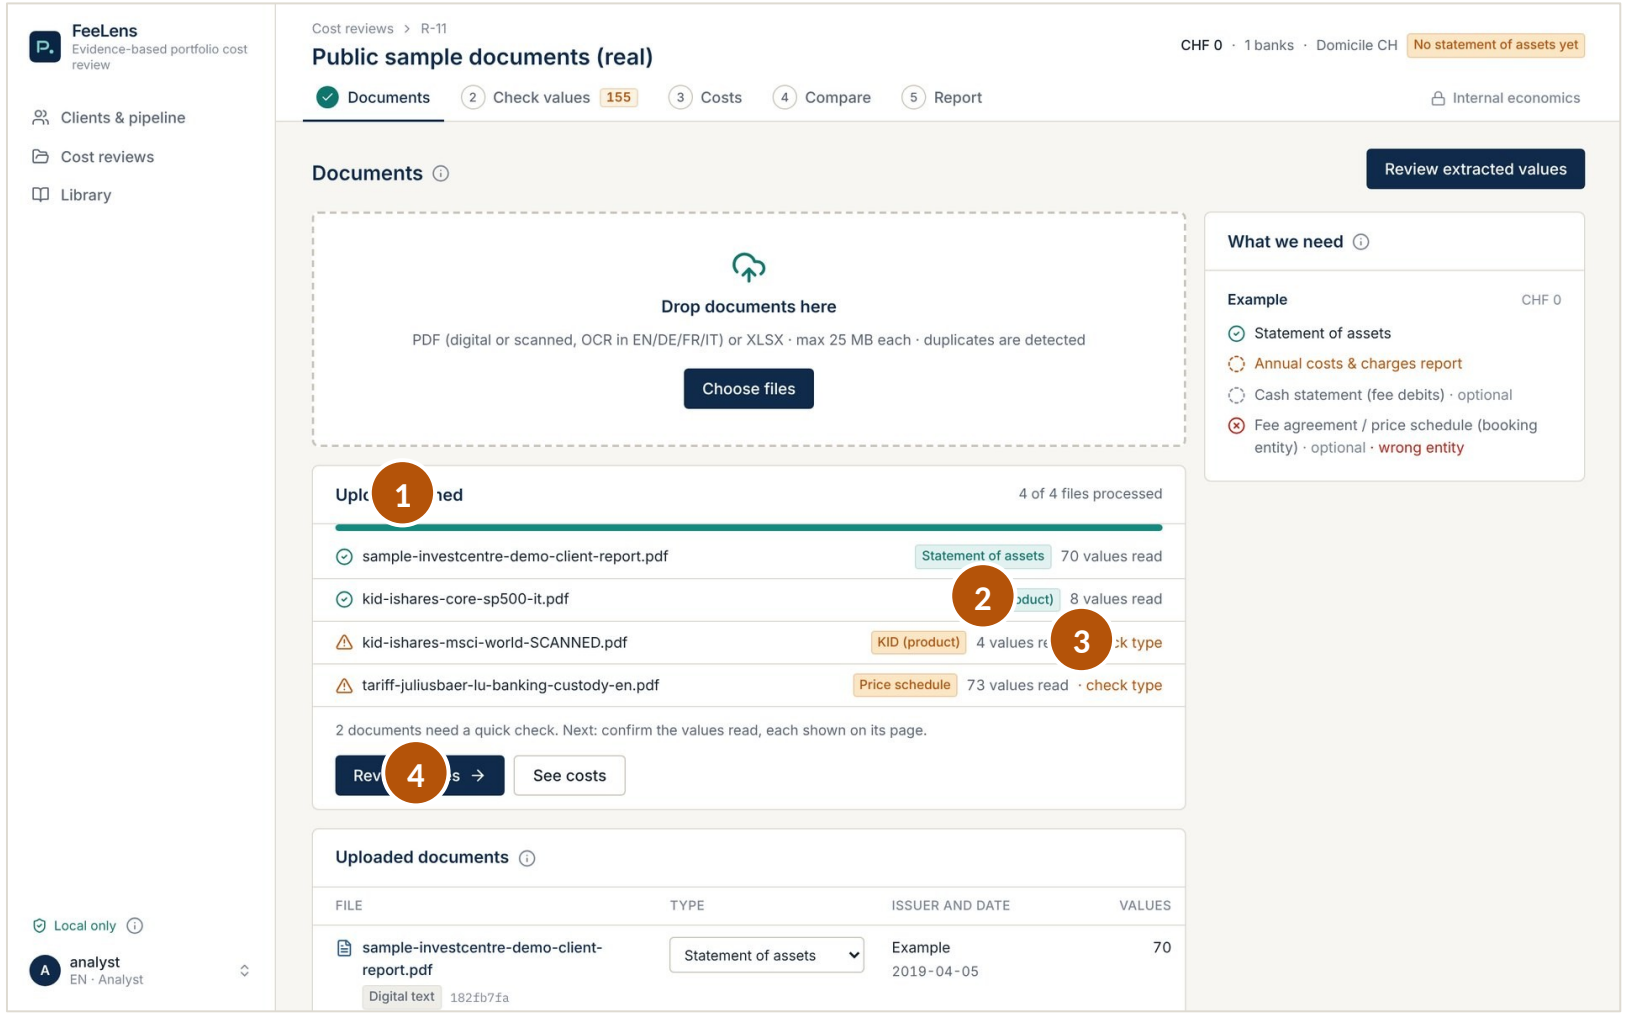

**2** **Pick the tax domicile**

Decides whether 8.1% Swiss VAT applies to the proposed fees.

**3** **"Create and upload documents"**

Opens the upload page straight away.

# Upload everything: each file shows what was read

*Real public documents: AJ Bell demo report, iShares KIDs (one re-scanned as an image), Julius Baer Europe price list.*

**1** **Drag the files or "Choose files"**

Digital or scanned PDFs (OCR in IT, DE, FR, EN) and Excel. Duplicates are detected.

**2** **The type it recognised**

Statement, KID, price list… and how many values it read.

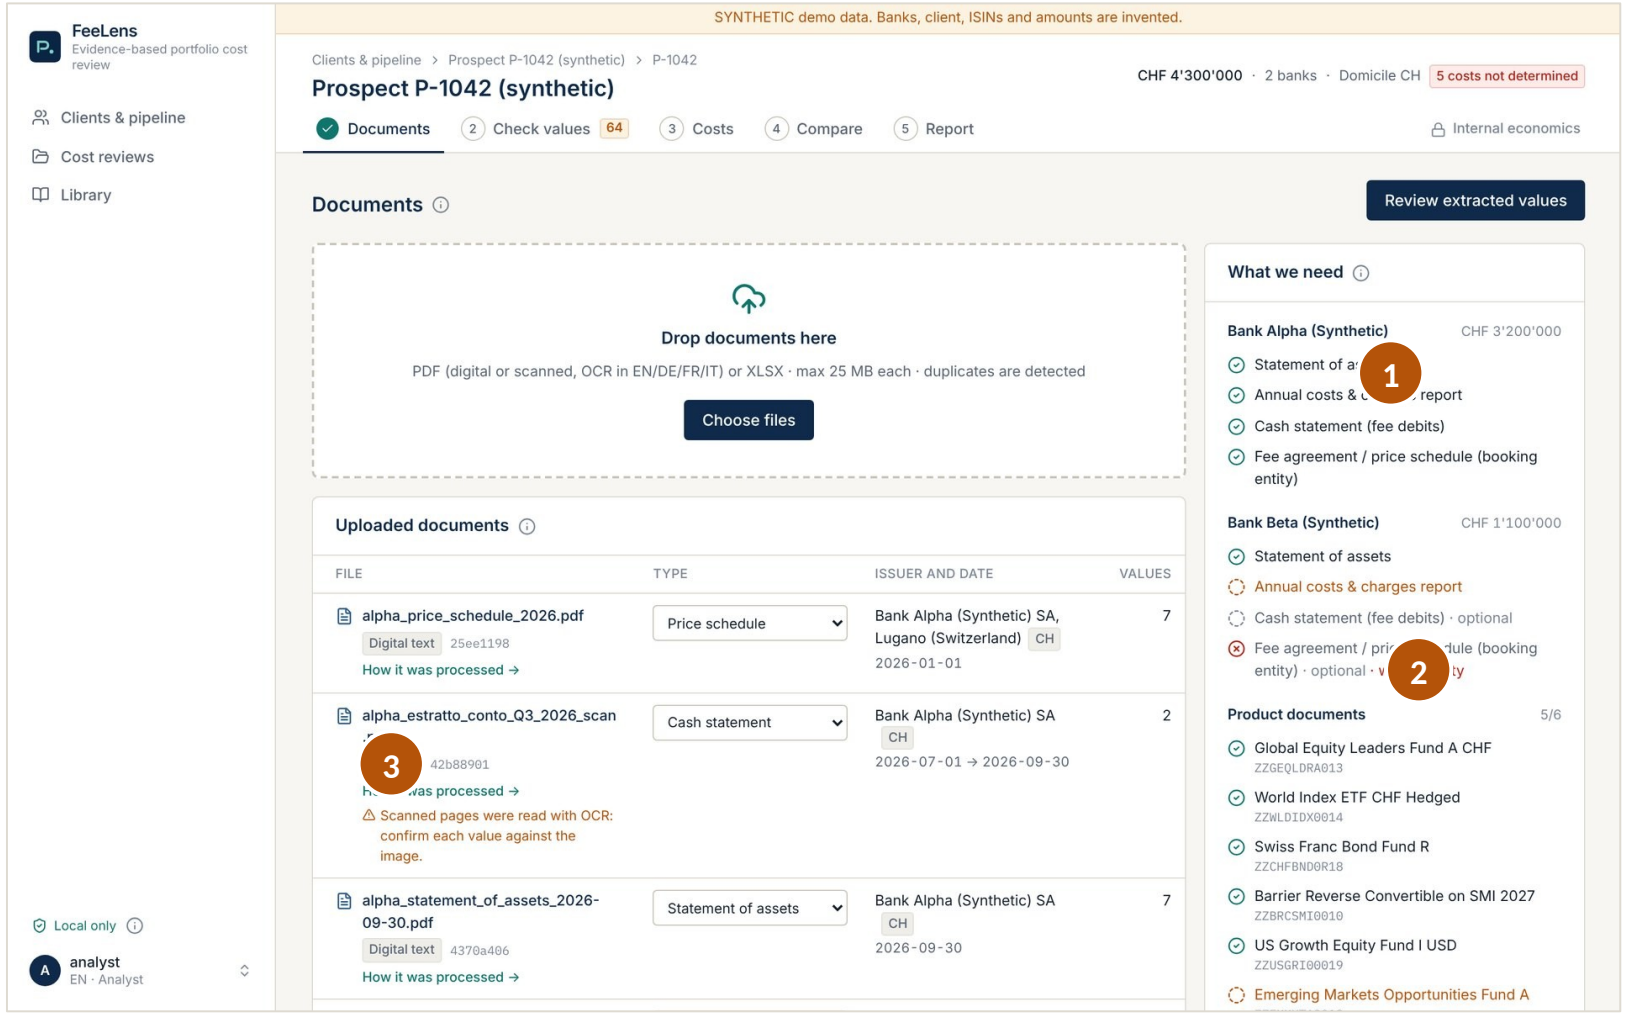

**3** **"Check the type" in amber**

A scanned file or a price list with several price columns asks for a confirmation.

**4** **"Review values"**

The next step.

# "What we need": the missing documents, bank by bank

*Synthetic prospect P-1042*

**1** **Green tick = document present**

Statement of assets, cost report, cash statement, price list per bank, KID per product.

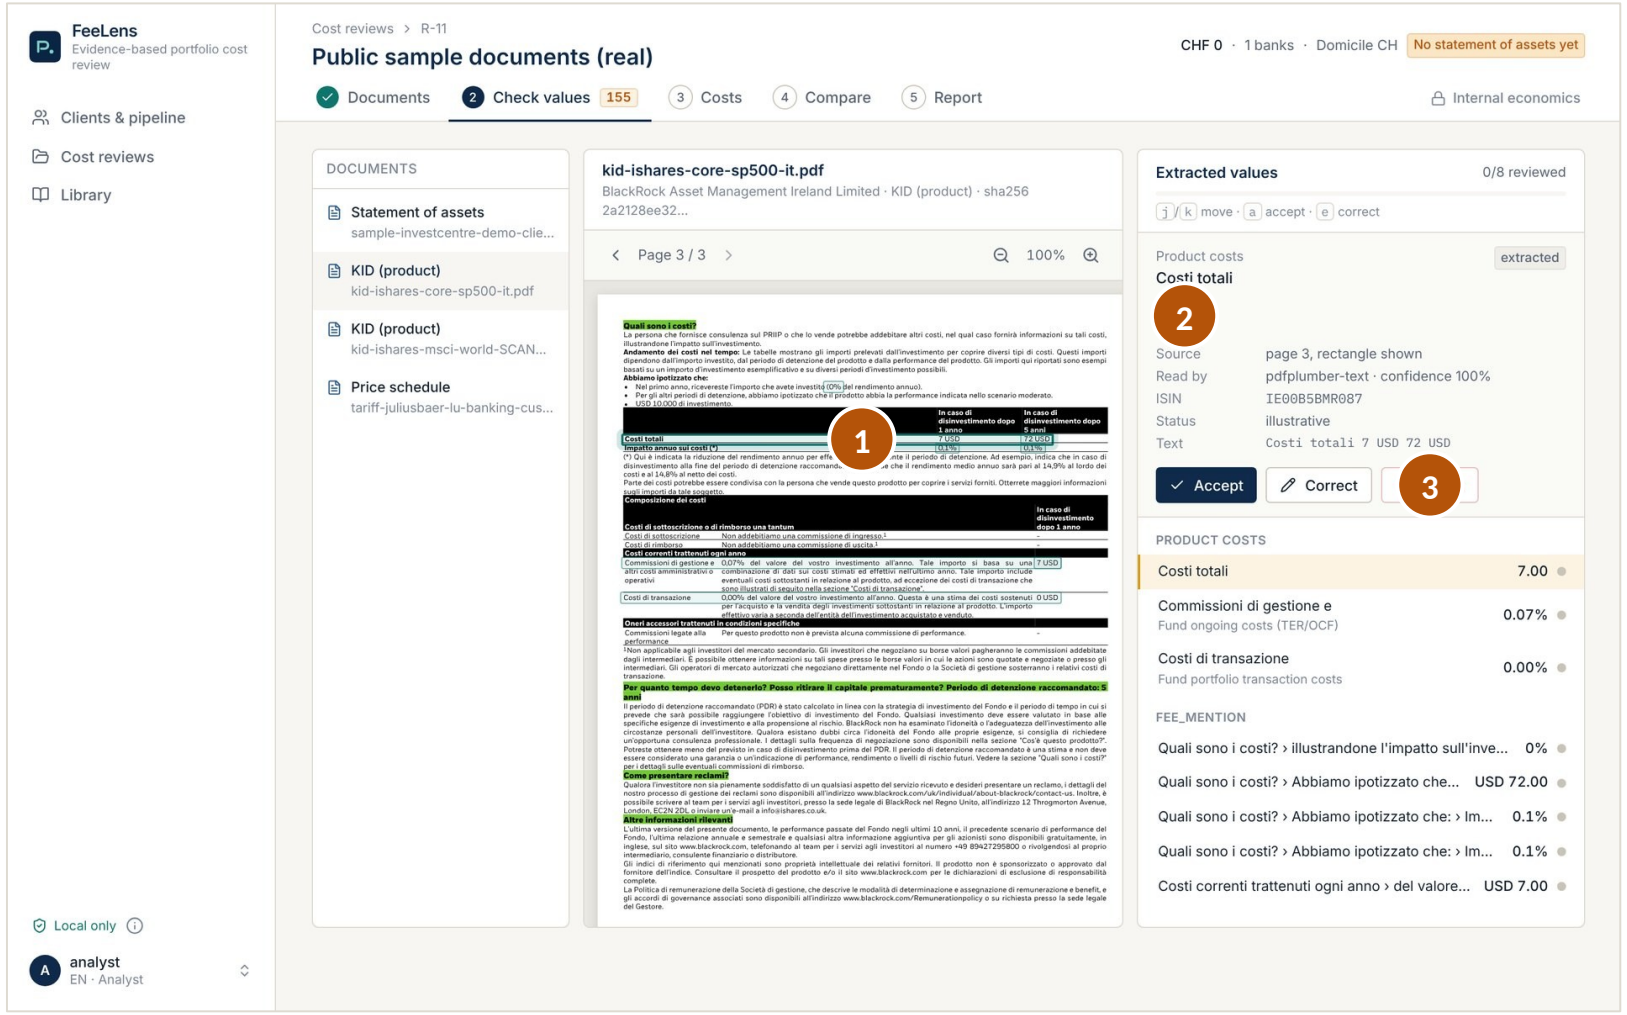

**2** **"Wrong entity"**

The price list belongs to another entity of the bank: tariffs apply only where the account is booked.

**3** **"OCR" label**

Scanned page: confirm each value against the image.

# Every value read, highlighted on the original page

*Real public documents: KID iShares Core S&P 500 UCITS ETF (IT), BlackRock.*

**1** **The green box on the page**

Shows the exact row the value came from.

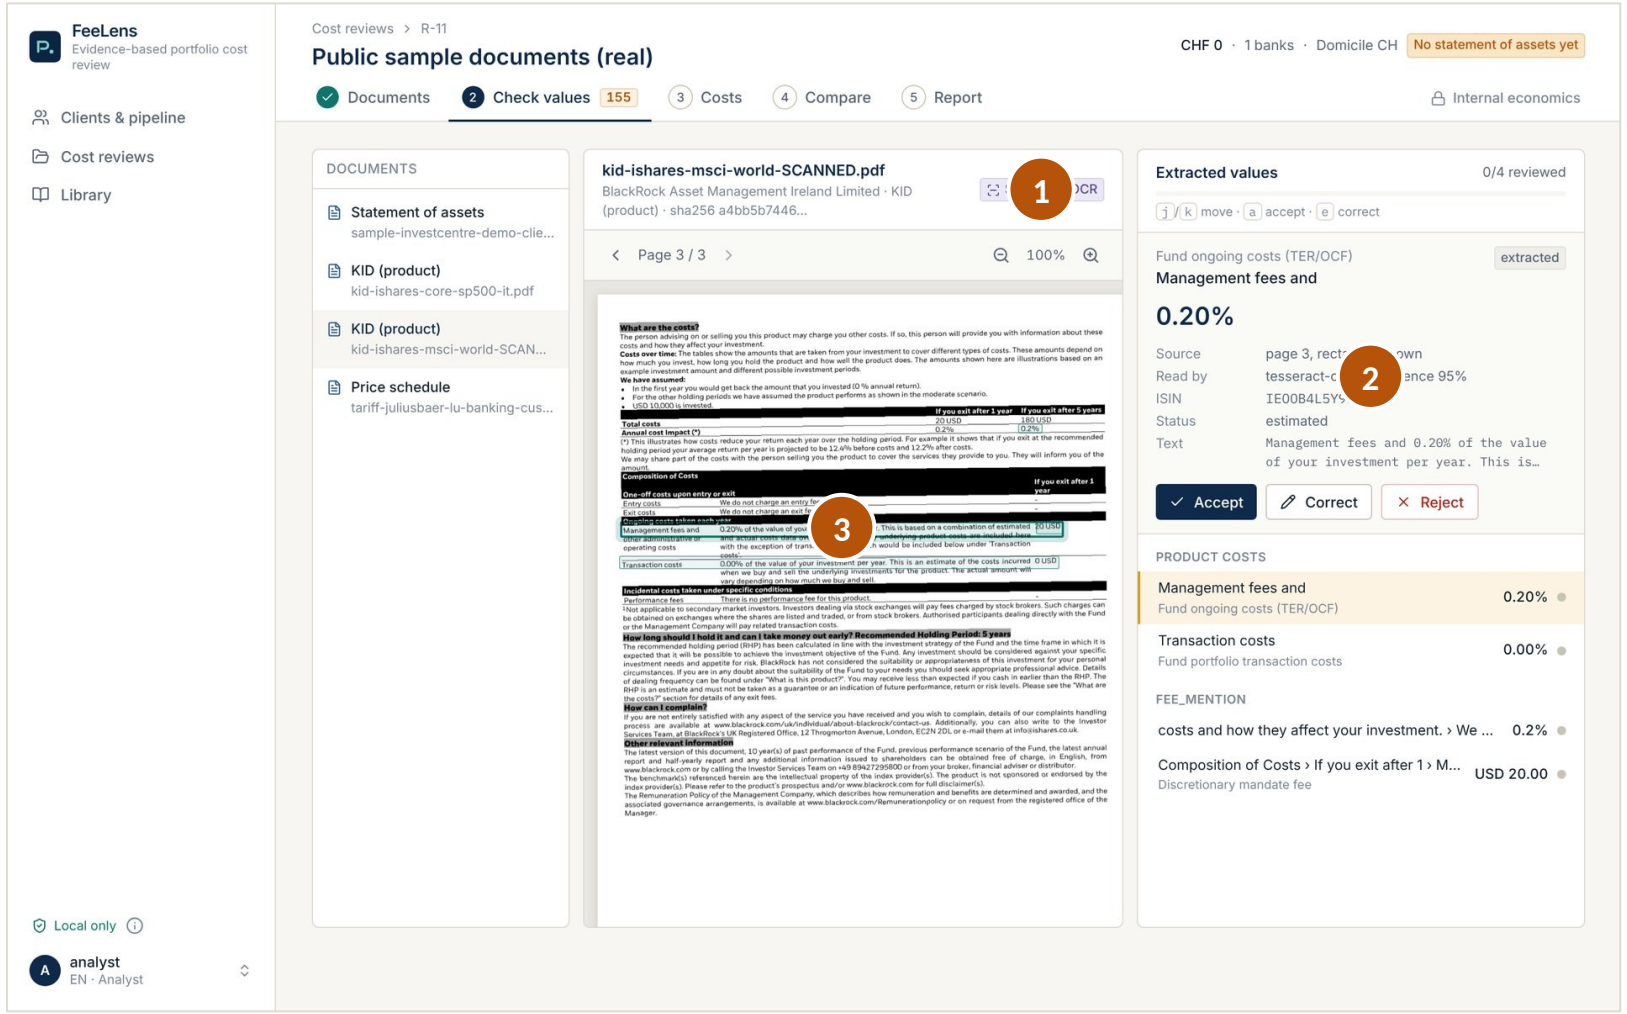

**2** **Check the value**

Here "Costi totali 7.00" is really USD 7 on a USD 10,000 example: not a rate.

**3** **"Reject"**

The wrong value stays out of every total. The right rate, 0.07%, is two rows below. Shortcuts: a, e, j/k.

# Edge case: a scanned page

*Real public documents: iShares Core MSCI World KID (EN), printed to an image to simulate a scan.*

**1** **"Scanned · OCR"**

The text was rebuilt from the image, on your machine, with no outside service.

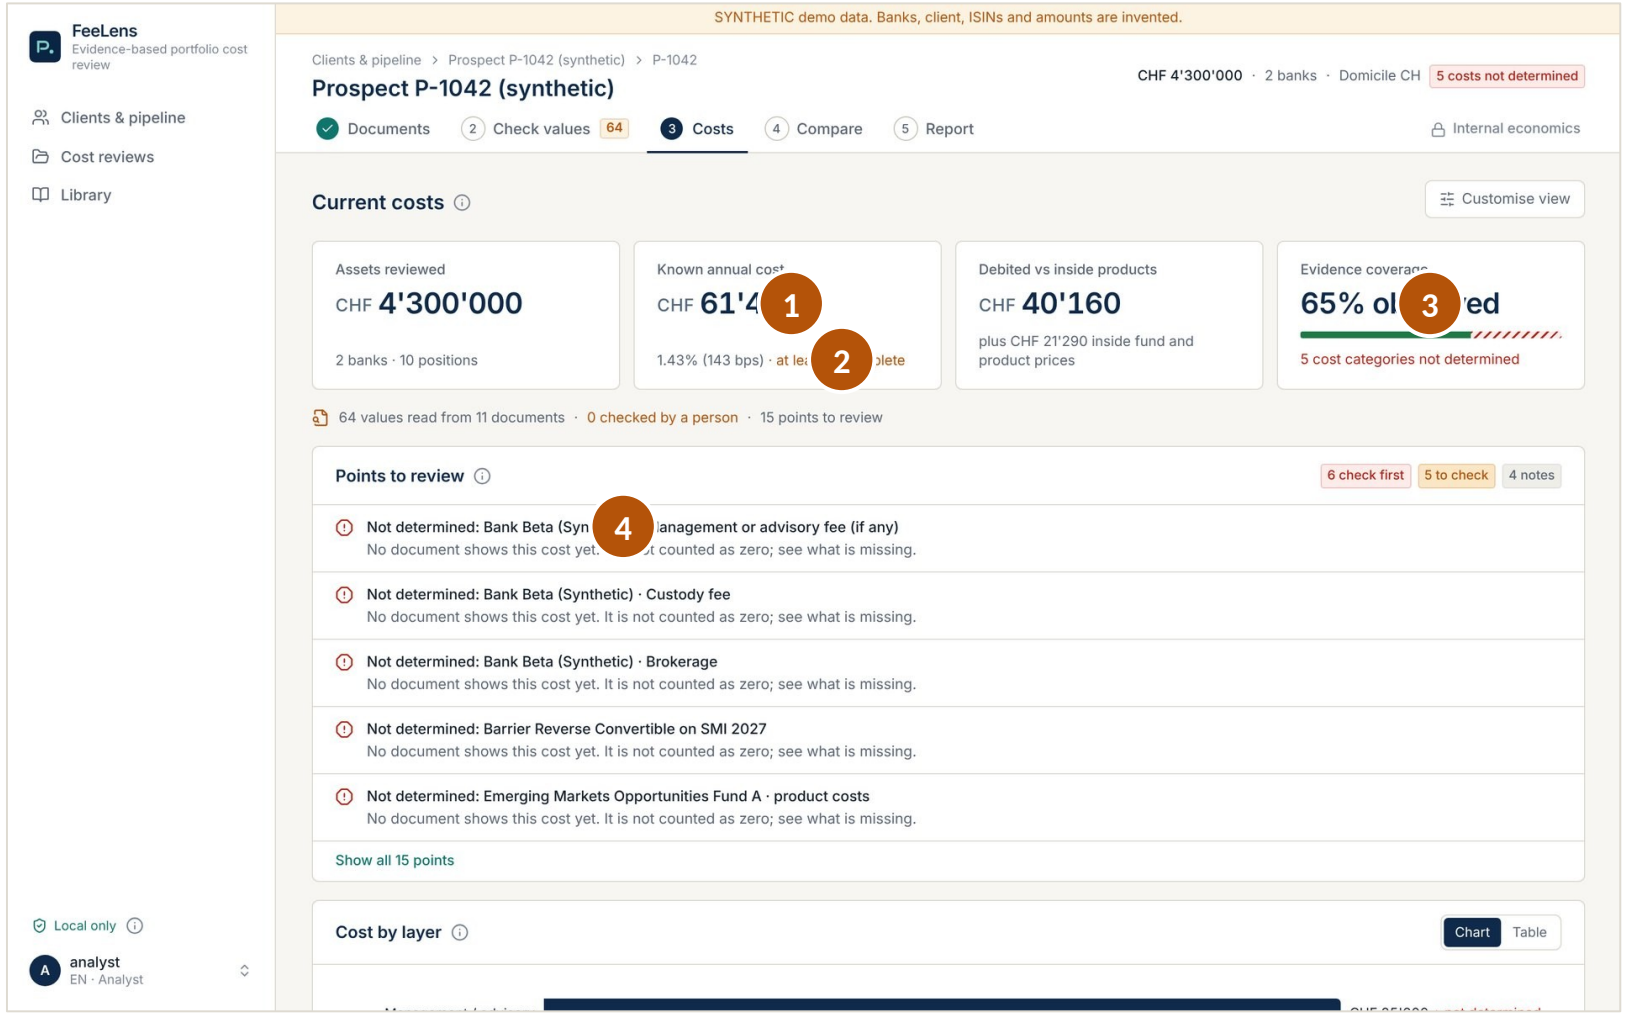

**2** **Who read it and how sure**

tesseract-ocr, 95%. Status "estimated" until a person confirms.

**3** **Compare with the image**

0.20%: correct. Accept and move on.

# The answer in four numbers, then what to check

**1 Known annual cost**

CHF 61,450, 1.43% of assets.

**2 "at least, incomplete"**

5 cost categories have no document yet: the true cost is higher; we do not invent it.

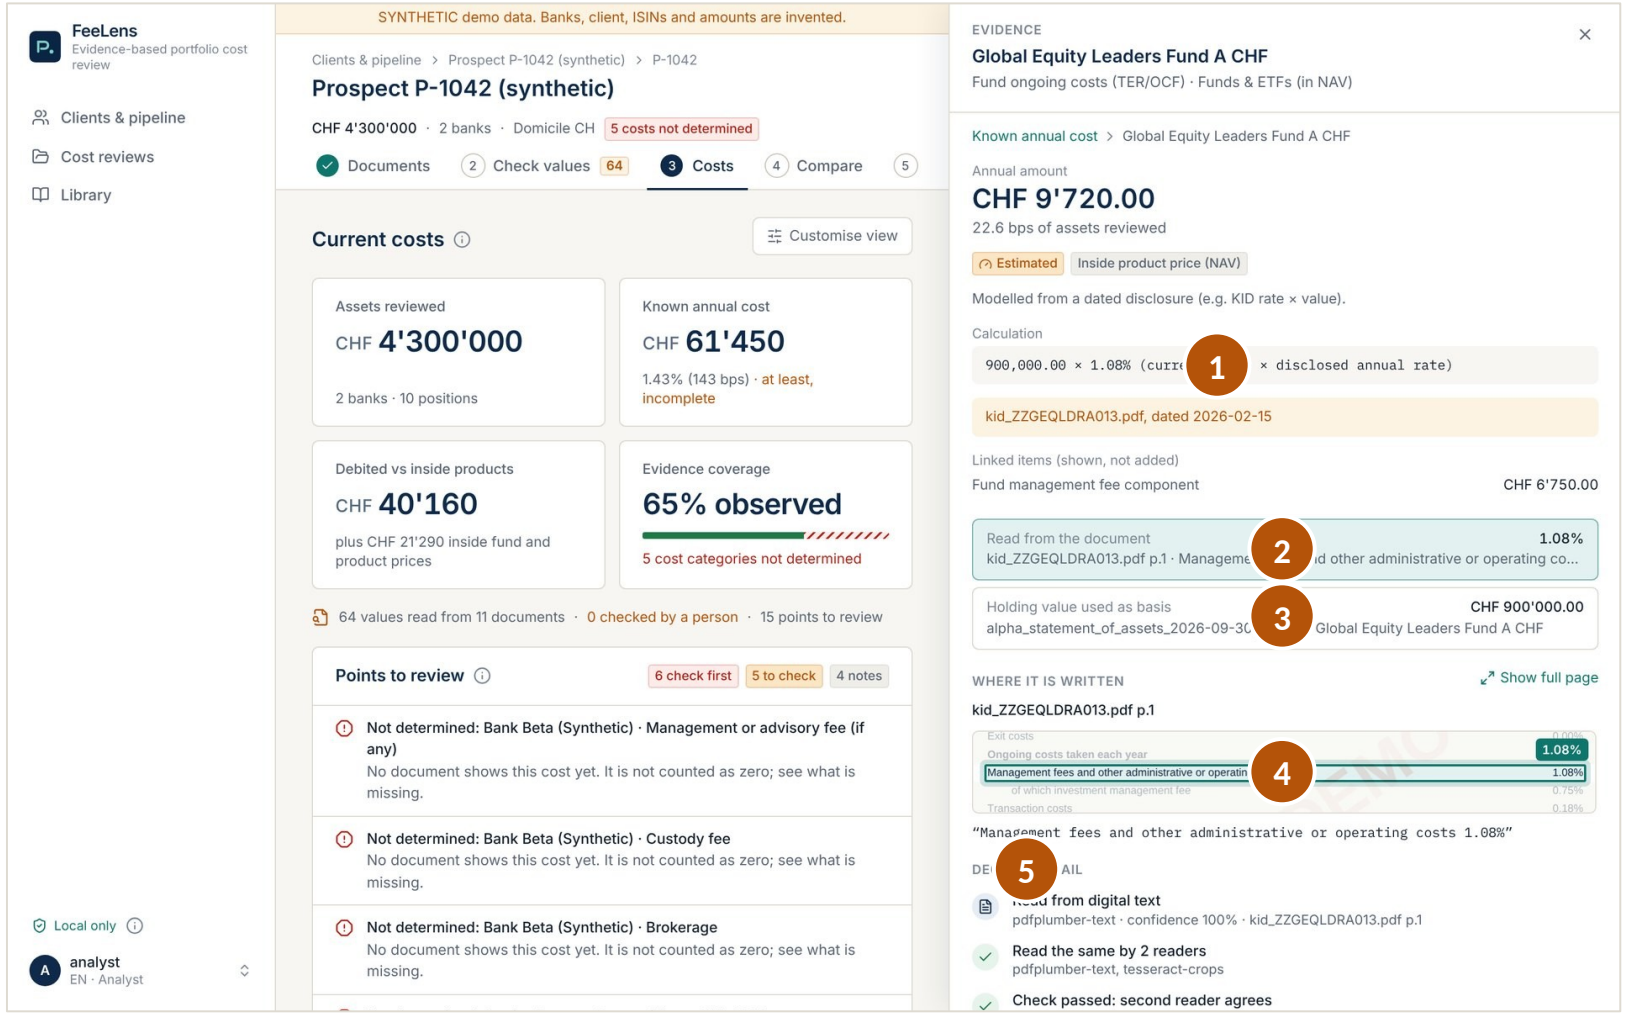

**3 Evidence coverage**

How much of the cost comes from an actual document.

**4 Points to review**

Ranked, most important first. One click opens the number.

# One click on a number: calculation, source and who checked it

**1 The calculation**

900,000 × 1.08%: holding value times the fund's ongoing cost.

**2 The rate, read from the KID**

With document and page.

**3 The basis, read from the statement**

Same holding, same ISIN.

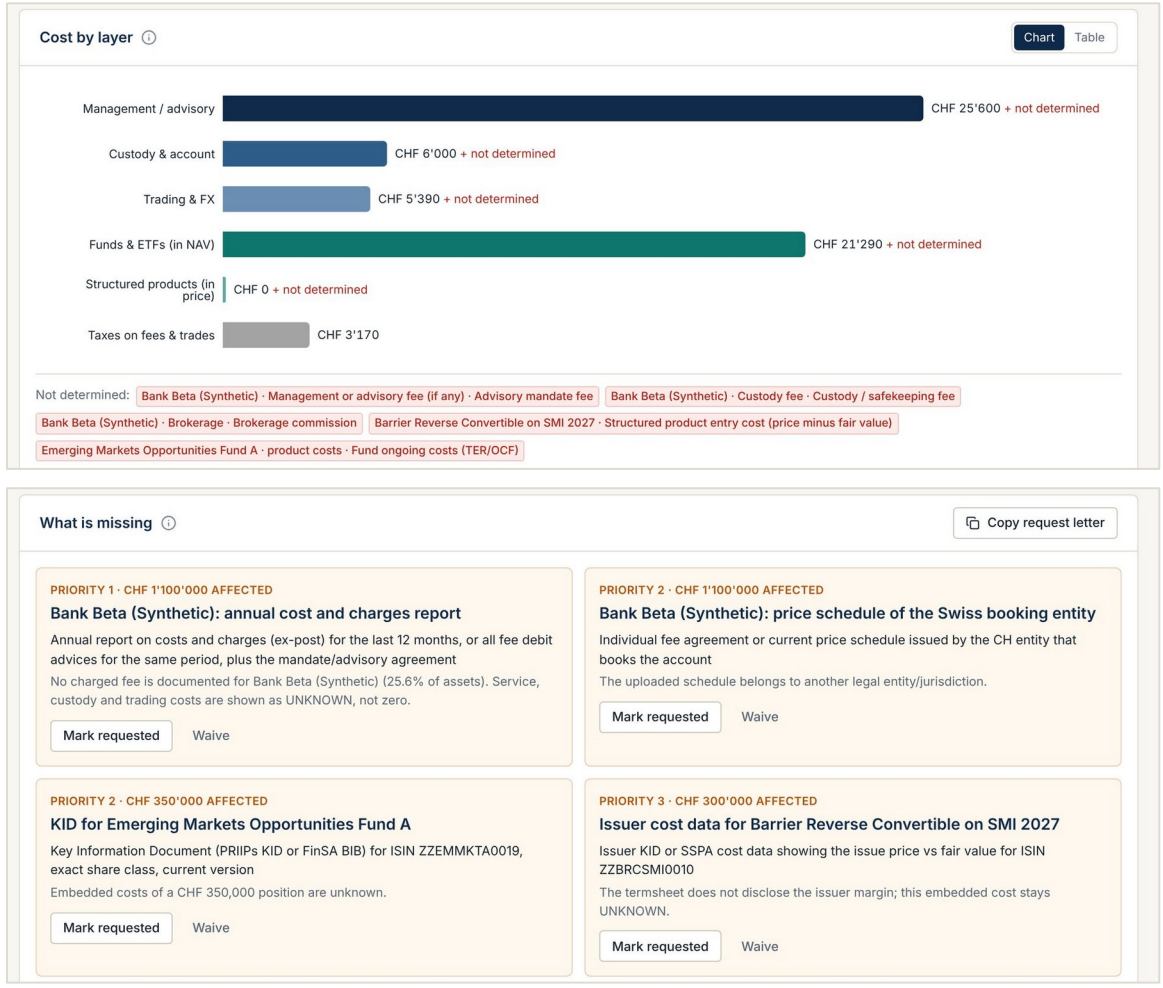

**4 Where it is written**

The page crop; "Show full page" for context.

**5 Decision trail**

How it was read, which checks passed, who accepted it.

# Missing is never zero: the app asks for the document

*Synthetic prospect P-1042*

**1** **The hatched bars**

"+ not determined": that part of the cost has no document yet. It is not counted as zero.

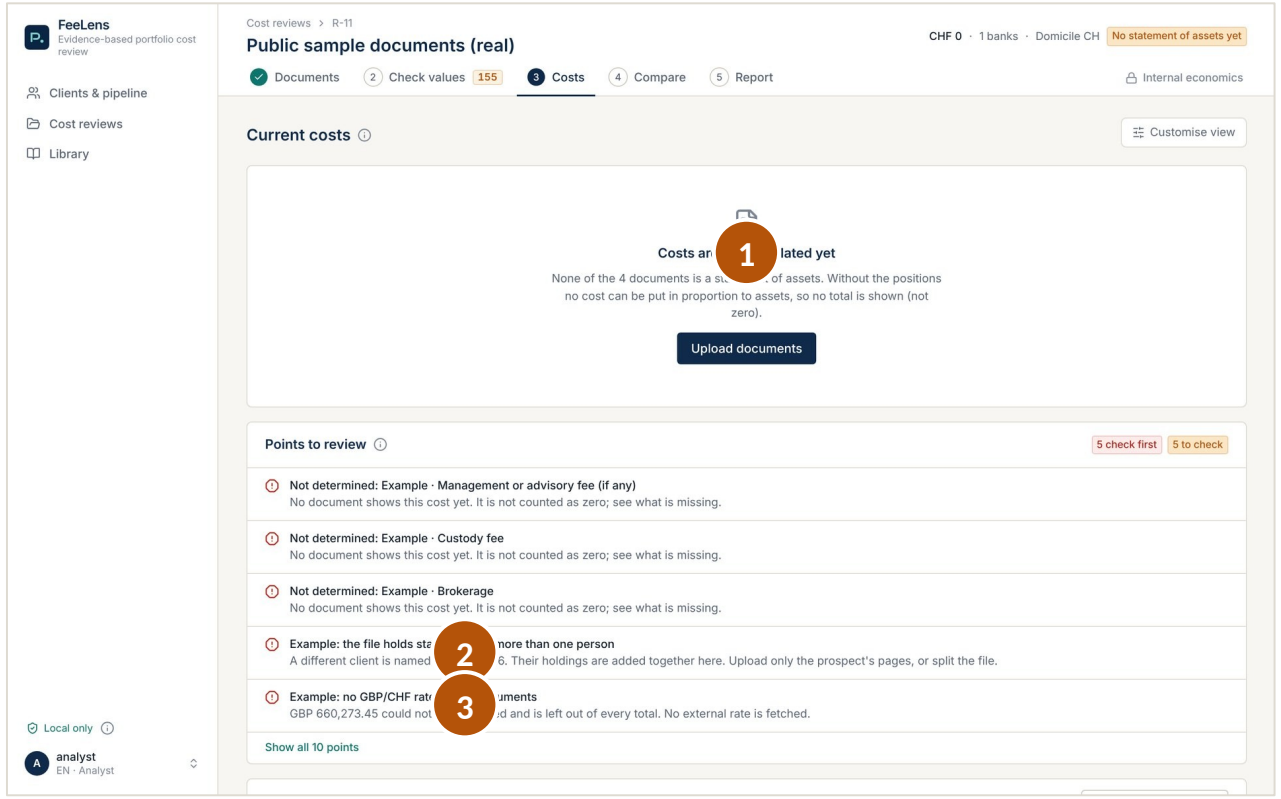

**2** **"What is missing", by priority**

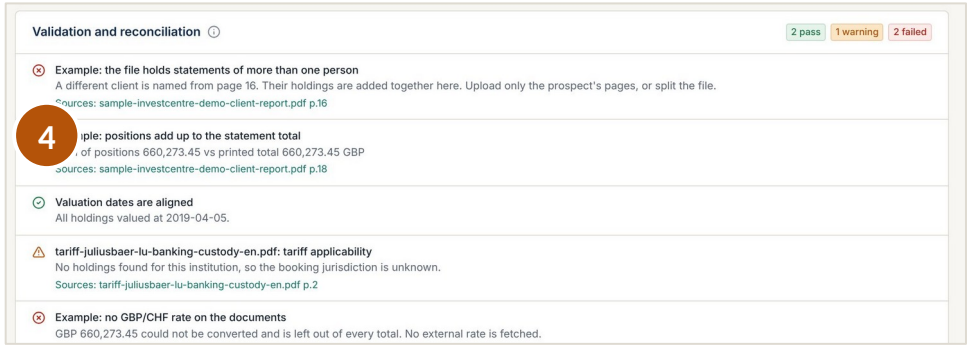

For each gap: which document is needed and how much of the assets it affects (e.g. CHF 1,100,000).

**3** **"Copy request letter"**

A ready letter for the client or the bank. "Mark requested" keeps track.

# On real documents the app stops and says so

### 1 Costs are not calculated yet

The statement is in GBP and no GBP/CHF rate is on the documents: no total, rather than a wrong one.

### 2 Two people in one file

Another client appears from page 16. Upload only your prospect's pages.

### 3 No invented FX rate

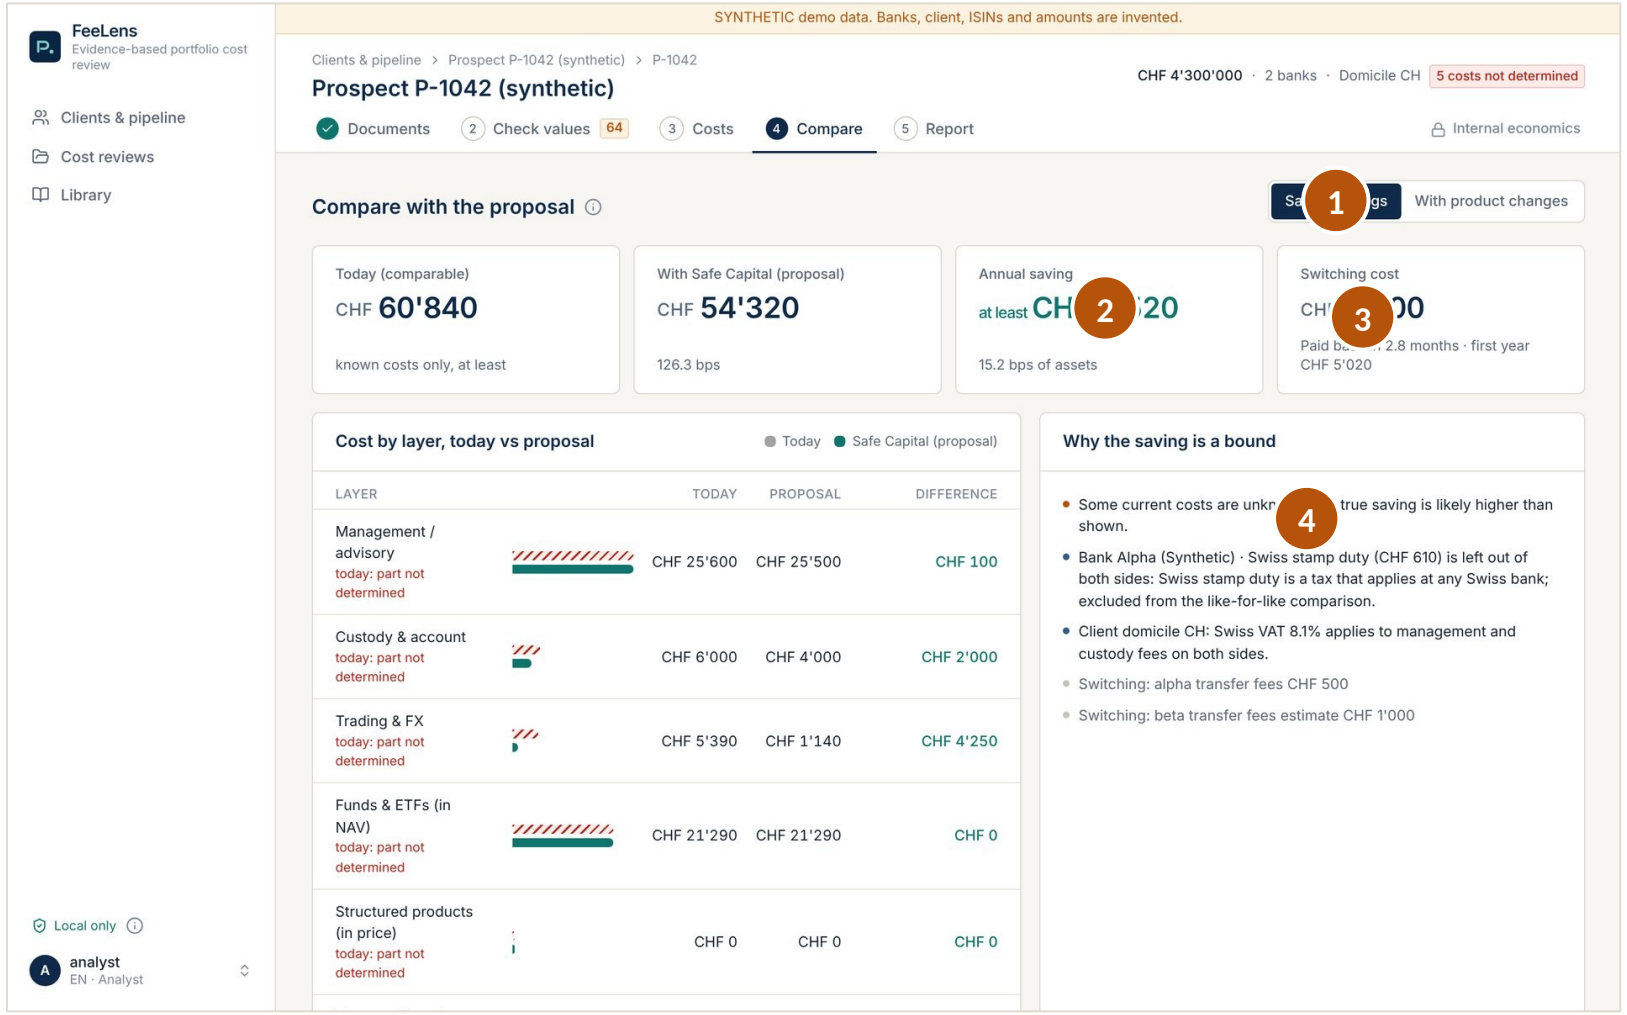

No rate is fetched from the internet; the page with the rate is requested.

### 4 Reconciliation

Sum of holdings = printed total (660,273.45 GBP): passed.

*Real public documents: AJ Bell demo client report (UK), 26 pages, two fictitious clients.*

# Like-for-like comparison: the saving is a lower bound

*Synthetic prospect P-1042*

**1** **"Same holdings"**

Same securities at your tariff. "With product changes" is a separate second scenario.

**2** **Saving "at least" CHF 6,520**

Worked out on known costs only, with VAT and stamp duty treated the same on both sides.

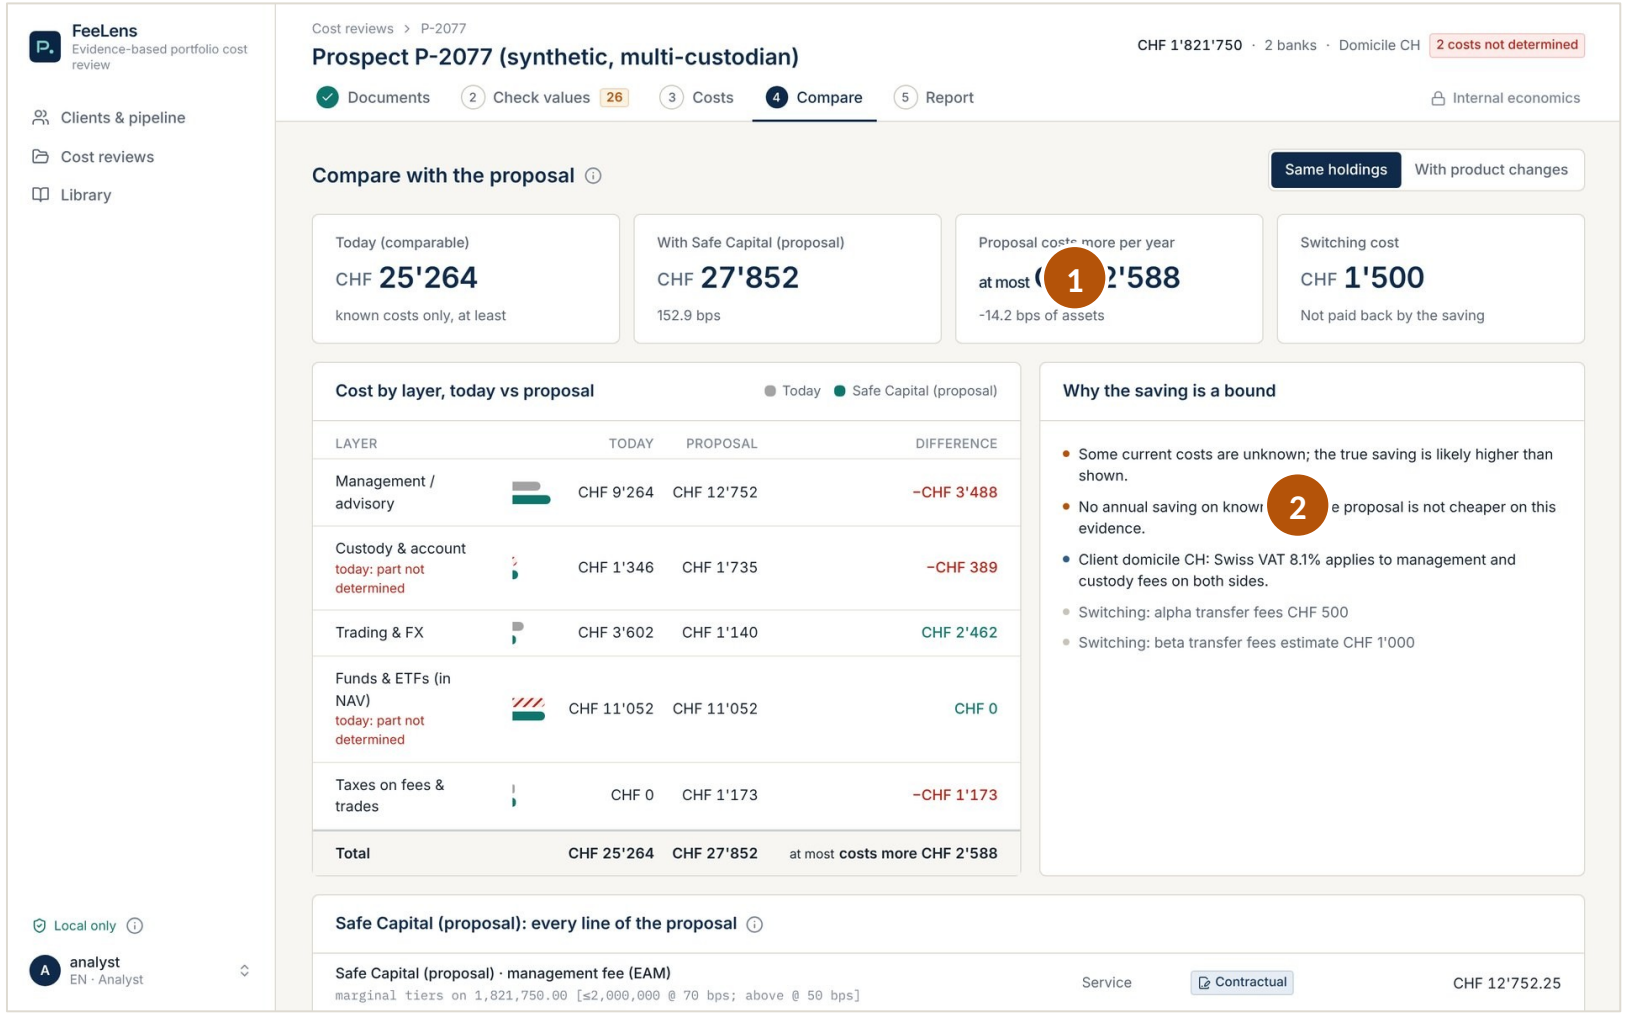

**3** **Switching cost**

CHF 1,500, paid back in 2.8 months.

**4** **Why it is a bound**

Explained in plain words you can repeat to the client.

# Edge case: when your proposal costs more, it says so

*Synthetic prospect P-2077: Italian bank in EUR and US broker in USD.*

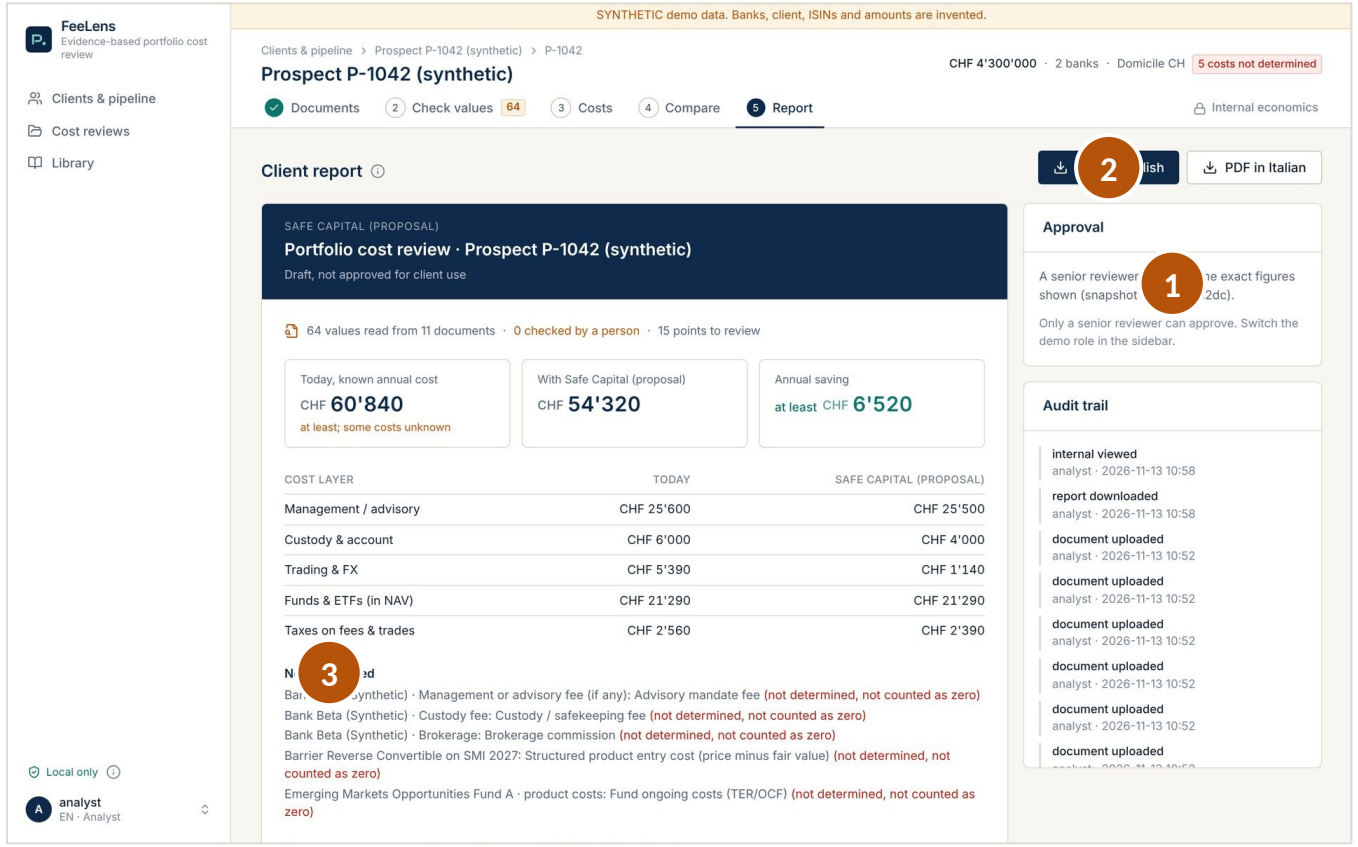

**1** **"Proposal costs more per year"**

At most CHF 2,588. Never shown as a saving.

**2** **No saving on known costs**

Useful before the meeting: better you find out than the client.

# The client report: a senior approves, then PDF

Your internal margin is on a separate page, for seniors only, and never enters the report (checked by automated tests).

PDF page 1

**1 Approval**

Only a senior approves, and approves the exact figures shown.

**2 "PDF in Italian / English"**

The same content, in the client's language.

**3 "Not yet verified"**

Missing costs are written in the report, not hidden.

EDGE CASES

# What the app does, what the analyst does

| Situation | The app | The analyst |
|---|---|---|
| **Scanned page** | Reads with local OCR, marks "OCR", status estimated | Confirms each value on the image |
| **Missing cost** | "Not determined", never zero; total "at least" | Requests the document (ready letter) |
| **Doubtful value** | In "Points to review", with the reason | Accepts, corrects or rejects |
| **Total that does not add up** | Reconciliation alarm with the page | Resolves it before anything else |
| **Two clients in one file** | "More than one person" alarm | Uploads only the right pages |
| **Currency with no FX rate** | Leaves the amount out, never guesses a rate | Provides the page with the rate |
| **Price list of another entity** | "Wrong entity": the tariff does not apply | Requests the right price list |
| **Fee inside the TER** | Counted once (1.08%, not 1.83%) | — |

ACCURACY

# How accurate it is, measured on real documents

**~90%**

of fees found on 63 real pages (899 fees checked by hand)

**5–6%**

of accepted figures still wrong: that is why two people check

**34/34**

holdings read on a real statement (Fidelity US), assets exact

**0**

silent asset errors on 4 public statements: every gap raises an alarm

## What this means for you

- A report uses dozens of figures: unchecked, one would almost certainly be wrong.
- With FeeLens the analyst checks instead of searching: every figure is already on its page.
- A senior approves the total, the saving and the comparison basis.

## What we do not know yet

- Swiss and Italian bank statements are not public: we tested them only on synthetic examples (100%) and on 4 foreign statements.
- The pilot measures the real accuracy on your documents, figure by figure.
- Small sample: the numbers above have a range (e.g. 86 to 93% for fees found).

IS IT READY?

# Ready for a supervised pilot, not for unchecked use

## Ready today

- ✓ Reads statements, KIDs, price lists, cost reports; scans with OCR
- ✓ Source and box for every figure; decision trail
- ✓ Alarms: totals, two people, missing FX, wrong entity
- ✓ Like-for-like comparison, IT/EN PDF report with approval
- ✓ No data leaves the machine (no outside AI)

## Before the first real document

| | |
|---|---|
| ○ Personal sign-in with two-factor (MFA) | us |
| ○ Delete on the client's request | us |
| ○ Encrypted disk, tested backup, retention | us |
| ○ Log of who views and downloads what | us |
| ○ Where the pilot runs | Safe Capital |
| ○ Impact assessment (DPIA), consent, compliance sign-off | Safe Capital |

WHERE IT RUNS

# The code runs at your office or in Switzerland, never on a public service

## A · A Safe Capital computer

*Recommended for the pilot*

- Everything stays in your office
- Encrypted disk, backups on your systems
- An existing PC is enough; new: CHF 1,500 to 2,500

## B · Server in Switzerland

*After the pilot, for more users*

- Infomaniak or Exoscale (Swiss data centres)
- Azure Switzerland if you use Microsoft 365
- Personal sign-in with MFA, database, backups

## C · Public demo

*Never for client data*

- Synthetic data only, to show the app
- Resets on every restart
- Not an option for real work

In every case: documents are read on the machine itself. No text, image or number is sent to ChatGPT, a cloud OCR or any other service.

PERSONAL DATA

# How we treat your clients' data

### Codes, not names

A review uses a code (P-1043). Names, IBANs and account numbers are not needed.

### Local only

No outside AI. Public lookups, if switched on, send ISINs only.

### Named users with MFA

Every analyst has their own sign-in; leavers are removed the same day.

### Deletion and retention

On request at once; otherwise 90 days after the meeting with no mandate (proposal, you decide).

### Audit log

Who uploads, views, corrects, approves, downloads. Logs never hold document text.

### Consent and DPIA

The client hands over documents for this purpose, with written consent. Safe Capital signs the DPIA.

To confirm with your counsel: Swiss FADP arts. 7, 8, 19, 24; FinIA art. 69 (secrecy); FINMA Guidance 08/2024 on AI. Not legal advice.

HOW TO USE IT

# A typical review at Safe Capital

1

## First meeting

The client signs consent and hands over statements, cost report, price lists.

Adviser

2

## Upload

Code, domicile, files. A few minutes.

Analyst

3

## Check

Assets first (alarms), then every cost figure: confirm, correct or "unknown".

Analyst

4

## Missing documents

Request letter to the client or the bank.

Analyst

5

## Four eyes

A second person checks total, saving and comparison basis, then approves.

Senior

6

## Second meeting

The approved report, in the client's language.

Adviser

**Target:** under 2 hours of analyst time per prospect, every figure checked. A full comparison today probably takes 6 to 10 hours (our estimate: to be timed with you on a real case).

PILOT

# Supervised pilot: 10 prospects or 3 months

## Before

- Install on one of your computers
- Half-day training
- Analysts and reviewer named
- Consent and DPIA signed

## During

- Only documents handed over for this purpose
- Every figure checked, every correction recorded
- We review the reports with the analyst

## After

- Pilot report (numbers only, no names)
- Decision: widen, fix or stop

## Criteria to move to full use (proposal)

**0**

wrong figures in any delivered report

**8 / 10**

prospects with annual cost within 5% even before review

**10 / 10**

prospects with assets within 1%

**< 2 h**

of analyst time per prospect

The pilot stops at once on any data incident or any wrong figure found in a report already delivered.

PRICE

PROPOSAL · TO CONFIRM

# What it costs: a pilot, then an annual licence

## Pilot

**CHF 3'000**

once, 3 months

- Up to 10 prospects
- Install at your office and training
- We review reports with you
- Pilot report
- 100% credited to year 1

## Essential

**CHF 9'000**

a year (CHF 750 a month)

- 3 users, 40 analyses a year
- Swiss hosting or your machine
- Updates, new bank layouts, backups, support
- Extra analysis CHF 200

## Professional

**CHF 18'000**

a year (CHF 1,500 a month)

- 10 users, 150 analyses a year
- Same services, priority support
- Extra analysis CHF 120

**Setup after the pilot:** CHF 5,000 once (users with MFA, your tariffs and templates, logo, IT/EN reports); half price for Safe Capital. **Founding customer:** 25% off year 1 and price held for 2 years, for a reference and anonymised pilot numbers. Prices exclude 8.1% VAT.

PRICE

# Why this price is fair

**~CHF 225**

per analysis on Essential (CHF 9,000 / 40)

**CHF 1'200–2'500**

for a portfolio analysis by a fee-only adviser in Zurich

stuzz.ch, 2026

**~CHF 16'000**

a year from one won CHF 2m mandate: pays the licence almost twice

0.8% net, our estimate

## Why not a price per document

- It pushes people to leave documents out: hidden costs stay hidden.
- A prospect with 30 PDFs would cost 6 times a tidy one.
- You pay per analysis: one prospect, all their documents.

## Market anchors

- Altoo (Swiss wealth platform): from CHF 15,000 a year.
- InvestGlass (CRM, Geneva): CHF 100 to 500 per user a month.
- No other Swiss tool publishes a price for this job.
- Our computing cost per analysis is near zero: no paid AI.

Sources: rfp.wiki (Altoo), investglass.com, stuzz.ch, opened 13 Nov 2026.

NEXT STEPS

# What we need from you to start

1. How many cost reviews a month do you expect? (picks Essential or Professional)
2. How long does a cost comparison take today, in hours? (we time one case)
3. Pilot on your computer or straight on a Swiss server? Do you use Microsoft 365?
4. Who are the analyst and the second reviewer (four eyes)?
5. Who signs the DPIA, the consent text and the retention period?
6. Does the second family office want to join the pilot?

## Proposed timeline

**Weeks 1-3:** we finish MFA sign-in, deletion, encryption and log; you do DPIA and consent.

**Week 4:** install and training.

**Months 2-4:** pilot on 10 prospects.

**End:** report and joint decision.

# Every figure with its source.

What is missing stays visible. The saving is a floor, never a promise.

**Proposal: 3-month supervised pilot, CHF 3,000.**

APPENDIX

# Where the numbers and pictures come from

| | |
|---|---|
| **Screenshots** | FeeLens app, main version of 13 Nov 2026, run locally. Prospects P-1042 and P-2077 are synthetic (banks, ISINs and amounts invented). |
| **Real documents** | AJ Bell demo client report (investcentre.co.uk); BlackRock iShares Core S&P 500 (IT) and Core MSCI World (EN) KIDs; Julius Baer Europe custody price list (2025). Public documents, fictitious clients. |
| **Accuracy** | 63 real pages, 899 fees checked by hand (workflow arena); 4 public statements (Fidelity US and UK, AJ Bell, Edward Jones). Repository: docs/READINESS.md, data/specimens/statements/RESULTS.md. |
| **Prices** | Doc "FeeLens pricing for Safe Capital", 13 Nov 2026: proposal to confirm. Market sources: stuzz.ch, investglass.com, rfp.wiki, ValIndex, moneyland.ch. |
| **Limits** | Some check messages in the app are still in English in the Italian interface. |
